Khmer Word Segmentation Tool [Demo]

NIPTICT has released Khmer Word Segmentation Tool (including model and script). These data are useful for Khmer Natural Language Processing (NLP). It is available as a Creative Commons Attribution-NonCommercial-ShareAlike 4.0 International (CC BY-NC-SA 4.0) License

Prerequisites

- Windows/Mac/Linux (recommend)
- Perl
- Download and install CRF++: Yet Another CRF toolkit (https://taku910.github.io/crfpp/)
- Tool
- Paper

Usage

1. Prepare your Khmer text in a plan text file with UTF-8 format (example: **khmer.txt**)
2. Download this tool and extract it. In terminal, go to directory **km-5tag-seg-1.0** Run the following command:

   ```
   $ ./km-5tag-seg-test.sh model/km-5tag-seg-model sample/khmer.txt
   sample-out/
   ```

3. You will see the two output files in directory **sample-out**

   khmer.txt.c
   khmer.txt.w

- khmer.txt.c : segmented output containing compound word (read this paper for compound word definition)
- khmer.txt.w : segmented output containing word form only
